

SIG TOOLS - SEMC

QuakOnn Liew

What we see today SF tools

- One thing on support would be that there are very few support channels (one? –the forum?!) and very few people that answers...
- Another thing would be that there are quite a lot of dependencies to other systems that are not in the foundation. –and hence lacking documentation. (blacktusk, symsee, grace, diamonds, hti?)
- Web site is a bit noisy. Hard to find what you're looking for. If using the “search” function you can get thousands of hits...
- Its positive that Nokia provides the foundation with plenty of needed assets.
- Some of the package owners are very reluctant to reply back. (CBR roadmap for instance...)
- The support methodology still needs to evolve as there is no guaranteed and correct answer for the question, sometimes you just get a workaround which will lead to new problems.

Going forward

- We are seeking the way of how and what could we contribute from SEMC to make better SW tools for Symbian platform development
-
- Some areas could be...
 - Eclipse plug-in (reltools, etc)
 - Etc....

THANKS FOR YOUR
TIME
